DIGITAL CULTURE

Our concern in the sphere of Digital Culture seeks to ensure presence of a Christian humanism in the sphere of rapidly developing digitalization in general and the emergence of artificial intelligence in particular.

An ongoing reflection with a variety of partners seeks to focus on the ethical developments in the area of artificial intelligence to promote the necessary values and ensure that such developments are truly put at the service of humanity. These developments influence the way we interact today, how we communicate, and the resulting issues for our very existence.

The initiative aims to promote an inclusive approach and dialogue for ethical reasoning, seeking to foster a diversity of research approaches and a multidisciplinary synthesis for feedback and enrichment of the different views on these issues.

This is part of the vocation to "read the signs of the times" together with all people of goodwill in a common commitment of dialogue and shared experience.
